## 1. TECHNICAL SPECIFICATIONS

MEASURE IN ACCORDING TO FTZ\_17R\_TR\_2049

### GENERAL

| Characteristics                       | Units | Value               |
|---------------------------------------|-------|---------------------|
| Frequency                             |       | LVHF(4-m) VHF (2-m) |
| Channel Spacing                       | KHz   | 20                  |
| Power Source                          | V     | 7.2V                |
| Frequency Stability (-30°C to +60°C)  | ppm   | ±2.5                |
| Modulation Type                       |       | 14K0F3E             |
| Antenna Impedance                     | Ω     | 50                  |
| Speaker Impedance                     | Ω     | 4                   |
| Microphone Impedance                  | Ω     | 2K                  |
| Operation Temperature                 | °C    | -30 to +60          |
| Relative Humidity                     | %     | 90                  |
| Battery Duty Life @ 5-5-90 Duty Cycle | Hr    | >8                  |

### TRANSMITTER

|                                    |               |  |
|------------------------------------|---------------|--|
| RF Power (H)                       | W             | 5.0W ( $\geq 4.0W \leq 6.0W$ )                                     |
| RF Power (L)                       | W             | 1.0W ( $\geq 1.0W \leq 1.3W$ )                                     |
| Max Deviation                      | KHz           | $\leq \pm 4.0$ @20KHz  |
| Adjacent Channel Power Attenuation | dB            | $\geq 70$  |
| Spurious Emissions & Harmonic      | dBm           | $\leq -36dBm$ from 9KHz to 1GHz<br>$\leq -30dBm$ from 1GHz to 4GHz |
| Audio Distortion                   | %             | $\leq 3$   |
| Audio Response Ref : 1KHz          | 300Hz~400Hz   | dB +1.0 to -3.0  |
|                                    | 400Hz~2.7KHz  | dB ±1.5  |
|                                    | 2.7KHz~3.0KHz | dB +1.0 to -3.0  |
| FM Noise (W/O CCITT)               | dB            | $\geq 40$  |
| Mic Sensitivity                    | mV            | $\geq 3.4 \leq 8.0$  |

### RECEIVER

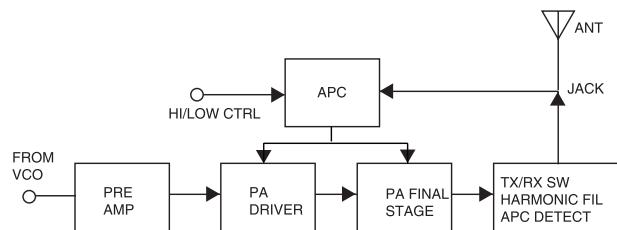

| Characteristic              | Units         | Value   |
|-----------------------------|---------------|---|
| Configuration               |               | Double Conversion Superheterodyne 1st IF (45MHz), 2nd IF (455KHz)     |
| Sensitivity @20dB SINAD     | dB            | $\leq 0.6\mu V$ (With CCITT)  |
| Squelch Sensitivity         | dB            | @ 16dB SINAD (Step L3)  |
| Blocking                    | dBuV          | $\geq 87$<br>$\geq 200KHz$<br>$\geq 500KHz$                           |
| Spurious Emission           | dBm           | $\leq -57$ from 9KHz to 1GHz<br>$\leq -47$ from 1GHz to 4GHz          |
| FM Noise (W/o CCITT)        | dB            | $\geq 45$   |
| Spurious Response Rejection | dB            | $\geq 70$   |
| Max Audio Output THD 7%     | W             | $\geq 0.5$ (4Ω)   |
| Audio Distortion            | %             | $\leq 3$  |
| Audio Response Ref : 1KHz   | 300Hz~400Hz   | dB +1.0 to -1.5   |
|                             | 400Hz~2.7KHz  | dB +1.0 to -1.5   |
|                             | 2.7KHz~3.0KHz | dB +1.0 to -3.0   |
| Standby Current Drain       | mA            | 60 (without power save)<br>30 (Power save 1:1)<br>15 (Power save 1:1) |

### MECHANICAL SPECIFICATIONS

|                            |    |  |
|----------------------------|----|--|
| Dimensions                 | mm | 126.5HX60.5WX44.5D                         |
| Weight                     | Kg | 0.38                                       |
| Shock Resistance           |    | Meets MIL STD 810 C/D/E/F                  |
| Moisture & Dust Resistance |    | According to the IEC529 & IP54 Regulations |

## 2. CIRCUIT DESCRIPTIONS

### TRANSMISSION UNIT

#### • PRE-AMPLIFIER

The pre-amplifier consists of **Q807 & Q808**. The VCO output signal is applied to pre-amplifier (Q807 & Q808), to obtain a level above 14dBm, while operating in the frequency range of 135MHz to 174MHz. The **T5V** supplies a 5V to pre-amplifier **Q810 & Q809** are turned on by T5V. The TX5 supplies a 5V to Q807 & Q808.

#### • RF POWER AMPLIFIER

The output signal of pre-amplifier provided the drive stage **Q801 (RD01MUS1)** and power amplifier **Q802 (2SK3476)**, to obtain Rf power above 6 watts. Its current drain is less than 2000mA, while operating in the frequency range of 135MHz to 174MHz.

#### • ANTENNA SWITCH

Antenna switch circuit consists of two PIN diode (**D801, D802**), transistor(**Q803**), and network(**C810 L814 C832**). In TX mode, TX5 supplies a High level to turn on **Q803 & Q804**, 5V bias is applied to the switch circuit to bias two diodes on.

The shunt diode(**D802**) shorts out the receiver port and a high impedance between L814 and harmonic filter.

In receive mode, the diodes are both off so it will form a low attenuation path between antenna and receiver ports.

#### • HARMONIC FILTER

Harmonic filter consists of **C807, C806, L803, C805, L802, C804, C803, L801 & C801** to form three poles low pass filter to attenuate harmonic energy of the transmitter.

#### • APC (AUTO POWER CONTROL)

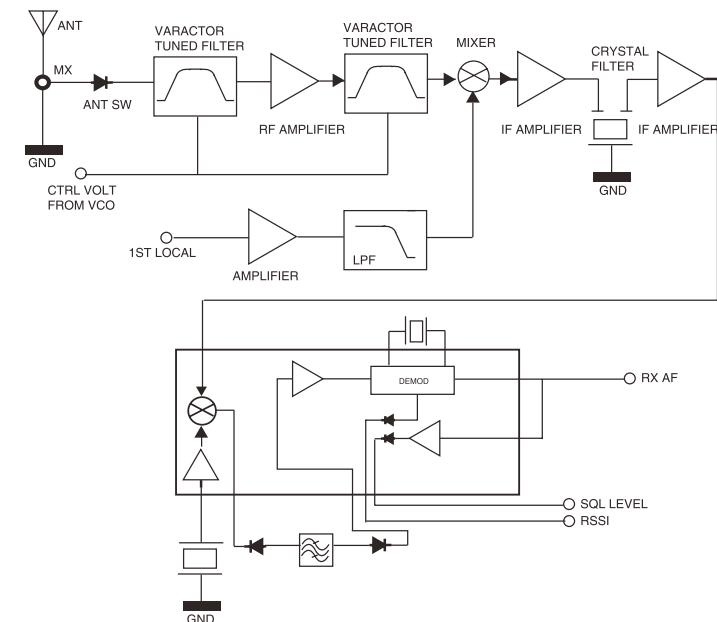

Transmitter with feedback voltage which controls driver stage(**Q802**) and final stage(**Q801**), stabilize rf output power. The feedback voltage is formed by **D803** and **D805**, to provide the U801(B) amplifier and voltage reference(A). It controls two stages, **Q801 & Q802**, to get bias voltage and forms an auto level control to stabilize transmitter output power.

#### • HIGH/LOW POWER CONTROL

PWM (pulse width modulation) which produce basically digital waveforms, the PWM level is fed to RC filter which is composed of **R888, R885, C841, C843** to change **U801A** pin 1 voltage for control RF power.

### RECEPTION UNIT

### • FRONT-END

RF signal is fed through antenna into low pass filter, which is composed of **C801, C802, L801, C803, C804, L802, C805, C806, L803, C807**, then goes into TX/RX antenna switch, which is composed of 2 PIN diode (**D801, D802**), transistor (**Q803**) and network (**C810, L814, C832**). RF signal is coupling with **C701** to varactor tuned band pass filter, which is composed of **L701, L702, C702, C703, C704 & D701, D702**, to change varactor diode (**D701, D702**) voltage to tune band pass filter shift band.

The control voltage of band pass filter is supplied from Q504, the voltage is controlled by VCO. The output signal of band pass filter is provided with RF amplifier transistor (**Q701**), the **C710** coupling into second band pass filter, which is composed of **L704, C711, C783, C712, L705, C713, C714, C715, C784, L706, C716, D704, & D705**. The **Q504** is controlled by VCO.

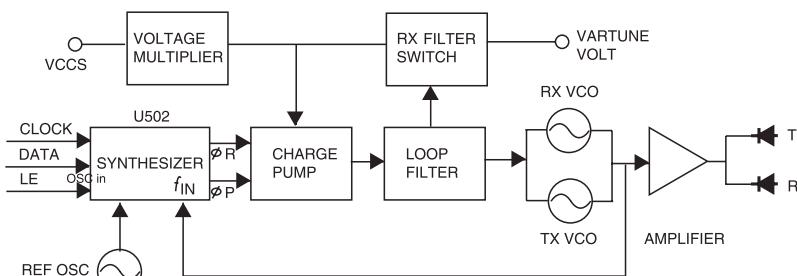

The voltage of Q504 controls the second varactor tuned band pass filter (**D704, D705**) band shift. The signal of RF amplifier and band pass filter are fed through **C717** coupling into double balance mixer. The signal comes from **T701**, matching with **D706, D707, D708, & D709**.

The first local signal comes from VCO output, then into local amplifier Q702 and low pass filter, the Low Pass Filter is composed of **C730, L710, C731, L711, C732**, the signal coupling with **C733** into transformer (T702) matching with **D706, D707, D708, D709**, The VCO using a high side injection the RF signal is down-converted to 45MHz IF signal , the signal output from **T701**. The IF signal output comes from mixer through **L715, C734 & C735**, coupling to RF signal attenuate and depress loop circuit, which is composed of **L713, C738, R715, L714, C736, C737**, and then, through IF amplifier (Q703) applied to crystal filter to provide necessary selectivity and intermodulation protection.

## • BACK-END

IF signal goes through IF amplifier **Q704, C747, L716, & C748** and it matches with **U701** pin 16 (IF). U701 pin 1 feeds second local frequency **44.545MHz**, there are two signals coming internal mixer. 2nd IF signal goes through U701 internal amplifier. And applies to demodulator, which used a ceramic discriminator to detect audio signal. U701 pin 9 recovers audio output. U701 pin12 supplies a received signal-strength indicator (RSSI) to microprocessor (U102), RSSI supplied received signal strength level to shown on LCD indicator. U701 functions have a noise amplifier and a noise detector level for microprocessor to control the squelch. The noise signal comes from demodulator (U701 pin9), then pass through **R738, C761** and then applied to pin 8 through internal noise amplifier. Noise detector supplies noise voltage for microprocessor (U101) to control squelch.

## FREQUENCY SYNTHESIZER

## • SYNTHESIZER

The PLL frequency synthesizer **U502** contains prescaler, phase detector, internal dividers, reference counter, there are controlled by micro-controller Clock, Data, LE VC-TCXO assures that the frequency remains stable across the temperature range (typically  $\pm 2.5$  ppm). besides VC-TCXO provide a modulation port for the sub tone modulation system. The reference frequency (VC-TCXO) goes through U502 internal programmer to 2.5KHz or 3.125KHz, and then goes through phase comparator to gain a  $\phi R$  signal from pin 16 (U502). The VCO provides a feedback signal match to U502 (pin 8 F-in), the port including a pre-scale N counter a counter, & swallow counter, to control VCO frequency divider to 2.5KHz or 3.125KHz. And then, goes through phase comparator to catch  $\phi P$  signal output from pin5 (U502).

$\phi R$  &  $\phi P$  signals applied to charge pump Q503 Q502 controls the loop filter, whose circuit consists of R514 C511. Then charge pump voltage pass to low pass filter, The low pass filter consists of **R512 C512 R513 C513**, supply a necessary DC steering voltage for VCO to gain a stable local-oscillation frequency.

## • VCO

### 1. RX VCO

The RX VCO includes transistor **Q602**, coil **L604**, **C611**, Varicap **CT601** and two varactors **D605** and **D606**, it is configured as a colpitts oscillator. its complexity comes from the balance between wide band and low noise needs. the resonant circuit produces a different frequency with a change in dc voltage controlled by the tuning voltage signal present at the cathode of D605 and D606, the local oscillator signal is applied to the amplifier Q601. D601 is

a dual diode, when 1 of 2 is reverse biased the other one is forward biased. Due to D601, the lo signal is applied to the mixer.

## 2. TX VCO

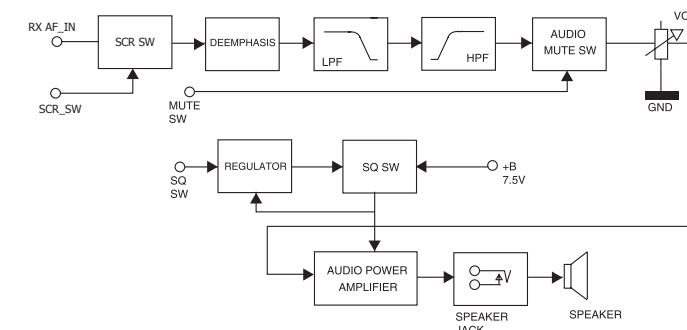

The TX VCO comprises transistor **Q603**, Coil **L607**, Capacitor **C621**, Varicap **CT602** and varactor **D603** and **D604**, it is configured as a colpitts oscillator. the resonant circuit produces a different frequency with change in dc voltage controlled by the tuning voltage signal present at the cathode of D603 and D604. the AF signal from R613 to the cathode of **D602** to produce FM modulation, the signal is applied to amplifier **Q601**.

RX and TX power line filters transistor **Q606** is configured as a 5V power supply ripple filter, the filter reduces the noise on the carrier and local oscillator signals.

## VOLTAGE MULTIPLIER

Voltage multiplier circuit consist of IC (**U501**), diode (**D501, D502**), **R501, R502, C502, & C503**. The DC/DC is set up to 10V. It goes through ripple filter (**Q501**) supply the charge pump (**Q502, Q503**) to control TX/RX VCO. VCO controls RX front-end band pass filter switch by **Q504**.

## AUDIO UNIT

## • AUDIO FILTER

The audio output signal of the demodulator and scr sw provides to low pass filter circuit.

The circuit is composed of **C319, R317, C320, R318, R319, C321, & IC (U302A)**, and then applied to low pass filter, which is composed of **R320, C322, R321, C323, R322, C324, & IC (U302B)**. The function of low pass filter is to attenuate 3KHz above audio signal.

## • AUDIO AMPLIFIER

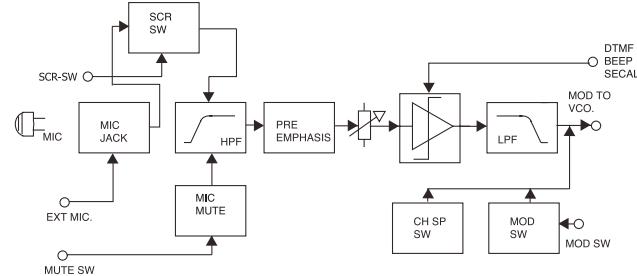

The audio signal is passed to low pass filter, which is composed of IC (**U302**), applied to audio mute switch control, then passed to volume control (**VR301**), applied to audio amplifier (**U301**), in the end, through **C318** to activate the speaker (**SP301**) by speaker jack (**J302**). The audio output power is more than 0.5W at 7% distortion.

## • SQUELCH CONTROL CIRCUIT

The noise signal of the demodulator output goes through **R738, C761**, into a tank, which is composed of **C760, L718**, and then goes through **U701** internal noise amplifier, the noise amplifier provide noise signal voltage from U701 pin13 is applied to MCU U101 pin29 (A/D) sampling; in the end, by SQ SW (**U202**) pin11 to turn on transistors(Q302, Q303) and to

control audio power amplifier (**U301**). The mute control switch is achieved with U202 pin 12 to control transistor (**Q301**) to mute demodulator signal. The U202 control by MCU(**U101**).

#### • TX AUDIO

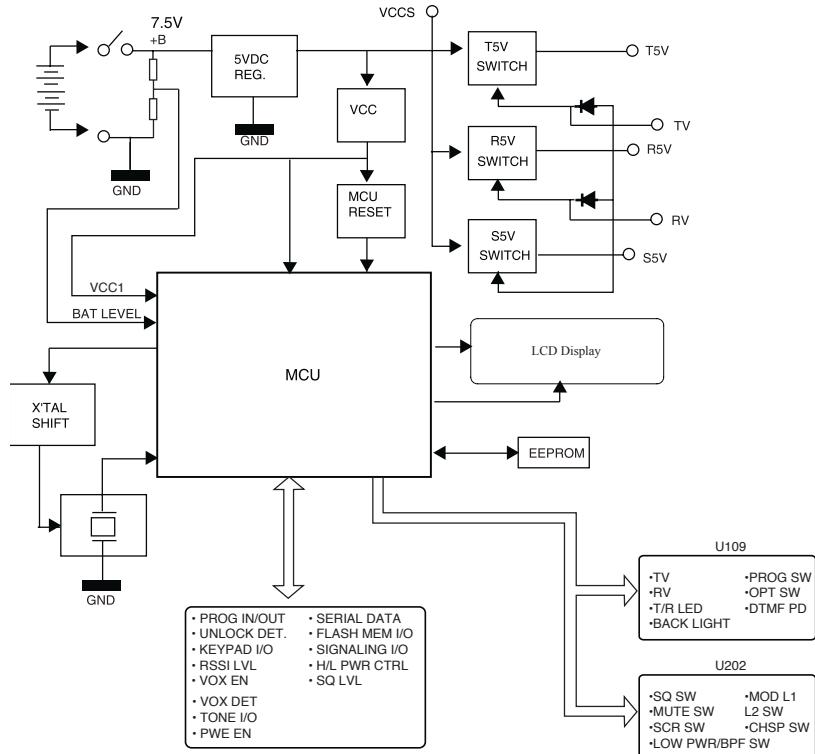

The audio signal is passed to high pass filter from microphone jack and scr sw, the high pass filter contains **C402, C403, C404, R413, R414 & U401(A)**, and then the signal gets into C405, R403, U401 (2/4) amplifier to an adjustment VR401 to limit modulation deviation, The U401(C) is limiter & combiner.

The U401(D) is low pass filter.

Q401 & Q402 control deviation channel spacing. Q403 controls microphone mute circuit.

Q404 that is control modulation level.

#### MICRO-CONTROLLER UNIT

#### DIGITAL CONTROL

MCU (U101) is an 8-bit micro-processor with 64KB ROM & 2KB RAM memory.

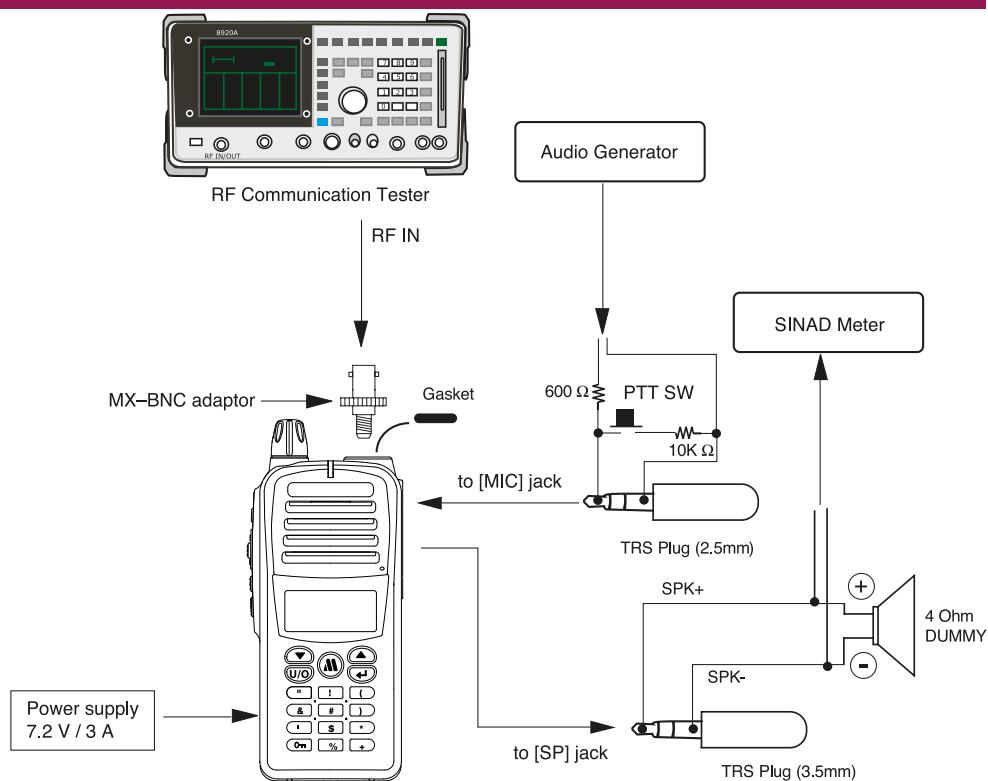

Micro-processor functions as following:

- LCD driver.
- EPROM programming read/write.
- TX / RX mode control.
- Keypad I/O control.
- PTT (Push To Talk) control.
- RSSI Indicator of radio signal-strength.
- Squelch control.
- MCU clock shift control.
- Series clock and data control.
- Hi / Lo power & power enable control.
- Indicator of battery capacity.

#### • POWER SUPPLY CIRCUIT

The Power energy is from 7.5VDC NI-MH or li-ion battery pack which offer to audio power amplifier & TX PA unit supplies to regulator (U201) for obtain converted 5VDC (VCCS) supply for digital, Q201 (T5V), Q202 (R5V), Q203 (S5V) and TX5.

### 3. Alignment

#### GETTING STARTED

please remove gasket on mx connector, connects the antenna jack to RF communication tester by MX-BNC adaptor. To follow above installation setup carefully.

Firstly, please program the radio same as alignment channel setting.

To open the FuG 13B setting from programming software, following channel will appear  
Operator can press Up/Down button to select the channel during alignment.

|    |      | Frequency |          | Pwr |        | CH spacing |    |    | Zone  |
|----|------|-----------|----------|-----|--------|------------|----|----|-------|
| CH | TA G | Low       | Hi       | H/L | MON    | TOT        | TX | RX |       |

#### VCO ADJUSTMENT

Connect test point (TP501) to multimeter for adjustment (ref alignment illustration).

Set channel=509, to adjust the CT601 obtain TP501 = **8.6V** for Rx VCO at receiver mode. to adjust the CT602 obtain TP501 = **8.5V** for Tx VCO when PTT was activity

#### FREQUENCY ERROR ALLGNMENT

Set channel=**509 wo**, to adjust the VR501 to get transmission frequency=**87.255MHZ ± 200Hz** when PTT was activity.

#### DEVIATION ADJUSTMENT

Plug Mic jack from audio frequency generator.

Apparatus setting: Audio generator=1KHz/80mV.

Set channel=**347 wu**, To adjust VR401 to get maximum deviation  $\geq 3.7\text{KHz} \leq \pm 3.8\text{KHz}$  when PTT was activity. Recheck Max. Dev  $\pm 3.5\text{KHz}$  at the channel **509 wo**.

1750Hz Adjustment: Set CH=**347 wu**, press burst tone I key to adjust VR404 to get Max Dev  $\geq \pm 3.5\text{KHz} \leq \pm 3.8\text{KHz}$  and check frequency is below  $\pm 20\text{Hz}$ .

2135Hz checking: check burst tone II deviation is between  **$\pm 3.5\text{KHz}$  to  $\pm 3.9\text{KHz}$** . and check frequency error is below  $\pm 20\text{Hz}$ .

#### HIGH POWER CHECKING

Set channel=**509 wu/wo**, to check transmitter power is above **5W± 1W**.

The transmitter's power is above **5W** and current is below **2.0 ampere** by checking the other channels.

#### LOW POWER CHECKING

Confirming the transmission power between **1.0W to 1.3Watts** at channel **347,416,486** and **509** with wu/wo. To make sure when battery voltage is below **6.4V**, the transmitter power was automatic changed to low power mode.

#### SENSITIVITY

To connect SINAD meter and 4 ohm dummy load

Apparatus setting: RF signal generator Frequency=**87.255MHz**, level=**0.43uV**, deviation=**2.4KHz**, AF=**1KHz** with CCITT filter

Set Channel=**509 wo**, press "monitor" button, observing the SINAD meter is above **20dB**

To confirm the channel=**347 wu/wo** as well.

#### AUDIO OUTPUT

Apparatus setting : RF signal generator level=1mV

Increase volume to get audio output level equal 1Vrms check audio distortion  $\leq 3\%$ .

Rotate the volume to make audio output distortion=7%, to check maximum audio output is  $\geq 0.5\text{Watt}$ .

#### SQUELCH ADJUSTMENT

Turn off the RF signal generator output and connect multimeter on test point (TP702). open the squelch setting.

Set channel=**509 wo**

Adjusting the **VR701** obtain the SND equal with **16dB**.

#### RSSI SIGNAL LEVEL CHECK

Turn on the RF signal generator output , setting RF level=**10uV**, make sure the signal meter is full on LCD indicator.

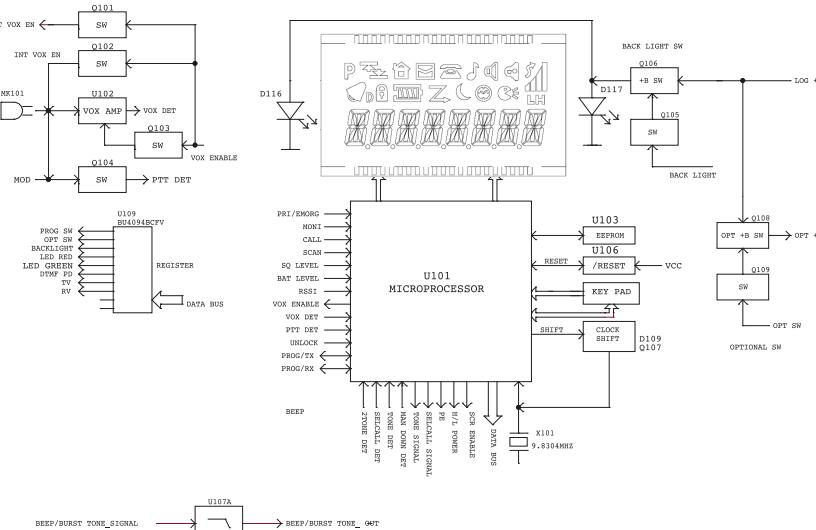

#### BATTERY LOW DETECTION

Connect to DC power supply.

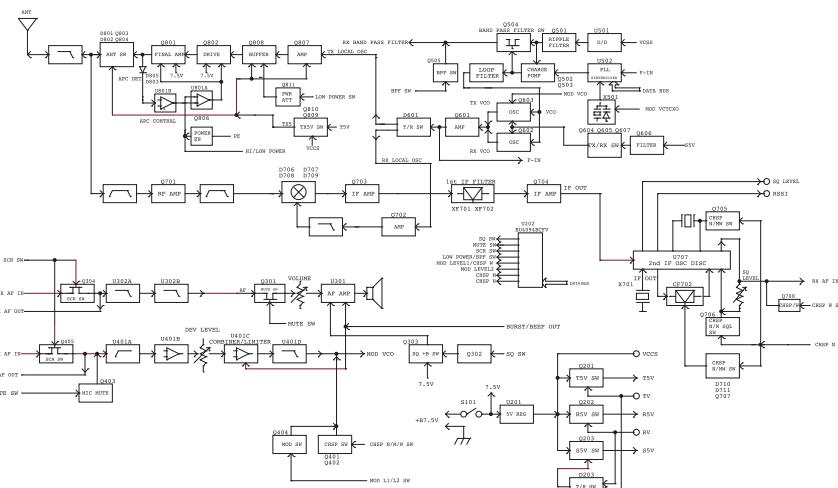

Adjust DC IN=**6.4V**, 1 battery bar is shown on LCD indicator when voltage in 6.4, increase voltage to **6.6V**, checking 2 battery bar shown on LCD indicator, increase to **6. 9V**, checking 3 battery bar shown on LCD indicator, increase to **7.2V**, that will show full battery bar on LCD indicator.
